Astana IT University
School of Software Engineering

Diploma Project

Development of a System for Detecting and Anonymizing Personal Data Before Sending Text to Artificial Intelligence Services

Supervisor Feedback Log

Authors: Dossan Amina, Abzhamal Nazerke
Educational programme: Software Engineering
Supervisor: Sakhipov A.A., PhD,
Assistant Professor

Astana, 2026

1. Purpose

This log records the comments of the supervisor on the project deliverables, the decisions taken by the team and the tasks in which they are implemented. Each entry refers to a YouTrack task (`DIP-<n>`) and, after implementation, to the pull request. The original document with the comments and the completed column of team decisions is stored in the same directory.

2. Feedback Sessions

Table 1: Feedback sessions

Date	Form	Reviewed materials
24 Oct 2026	Written comments on the archive of the main branch	README, proposal, literature review, technology comparison, requirements, evidence of relevance and survey responses, evaluation plan, project plan, UX prototype, diagrams, Presidio check

The supervisor noted that the documents are well developed, the requirements are measurable and trace to experiments, and the project includes a user survey and a pilot baseline check. Point 1 had to be closed before pre-defense 1, the other points before the start of implementation in November 2026. Points 2 and 3 are to be discussed at the next meeting.

3. Comments and Decisions

Table 2: Comments of 24 October 2026 and team decisions

#	Comment	Team decision and task	Deadline	Status
1	**Completeness and consistency of the materials** Existing system comparison missing in the main branch; README links point to non-existent .md files, unticked checklist, Figma placeholder, no feedback log. Survey sample inconsistent (n = 30 vs n = 35). Presidio check misreported in the evaluation plan.	**Accepted; closed before pre-defense 1.** — Existing system comparison (Presidio, Google Cloud Sensitive Data Protection, Limina, Casper, PromptShield) with the Presidio experiment added as docs/existing-systems — DIP-12. — Evidence of relevance recomputed on all 35 responses received by the data export on 22 Oct 2026 (3 later responses excluded and stated); n = 35 and the same percentages are used in all documents — DIP-5. — Description of the Presidio check corrected (configurations A and B over all languages) — DIP-16. — README links, status checklist and Figma link fixed — DIP-19; feedback log added as docs/supervisor-feedback — DIP-18.	Before pre-defense 1	Closed
2	**Project focus in light of the survey** Novelty framed around Kazakhstan identifiers, while the survey shows names, phones and e-mails as most frequent; the hard part is names and addresses in Kazakh, Russian and mixed text. No information security specialists among respondents. Question: who deploys the system and is the admin panel needed?	**Accepted; planned for November 2026.** — Novelty reformulated in the proposal and literature review: detection of names and addresses in Kazakh, Russian and mixed text with morphology-aware pseudonymization; structured identifiers are a supporting component — DIP-20. — Answer: the system is deployed by the information security or IT department of the organization. 3–4 interviews with information security specialists or DPOs (bank, university, public body) on FR-6 and FR-7 — DIP-21; if the need is not confirmed, the admin panel and auditor role are moved to Should.	Before November	Planned

Table 2 (continued)

#	Comment	Team decision and task	Deadline	Status
3	**Response restoration and morphology** Reverse direction of FR-3.2 not specified: restored names may have wrong case, gender or vowel harmony; tags hide gender and language from the model. Question: which replacement method and why?	**Accepted; experiment in November 2026.** — Answer: the current prototype uses typed tags; the final method is chosen by an experiment on 30–50 Russian and Kazakh prompts comparing (a) typed tags, (b) typed tags with gender and language attributes, (c) realistic surrogate names matched by gender and language (as in Casper) — DIP-22. — New requirement FR-4.5 (grammatically correct restoration: case, gender, suffix) and a metric for it in experiments 3–4 of the evaluation plan — DIP-22.	Before November	Planned
4	**Validity of the evaluation** Template corpus and generator rules make FR-1.1 almost guaranteed; real-world variants missing; Presidio without customization is a weak baseline. Question: what confirms quality on texts not written by the team?	**Accepted; planned for November–December 2026.** — Answer: an independent held-out set of 100–150 texts with fictitious data written by people outside the team (survey volunteers), including Latin script, transliteration, IIN with spaces, lowercase names and typos — DIP-23. — Second baseline: Presidio with minimal customization (IIN and phone regular expressions, Russian model); results reported separately for the template corpus and the independent set — DIP-23.	Before November	Planned

Table 2 (continued)

#	Comment	Team decision and task	Deadline	Status
5	**Threat model and legal status** Protection holds only for a cooperative user; the extension and server see full texts; pseudonymized text may remain personal data through context; compliance wording needs care.	**Accepted; planned for November 2026.** — "Threat model" section in the requirements: the system protects against accidental disclosure by a cooperative user, not against intentional bypass (other browser, phone, disabled extension) — DIP-24. — Deployment condition: the extension is force-installed by enterprise browser policy; minimal permissions listed (host access only to the ChatGPT and Gemini pages, storage). Server-side processing without storing original texts — DIP-24. — "Complies with the law" replaced with "reduces the risk of transferring direct identifiers"; limitations regarding quasi-identifiers described — DIP-24.	Before November	Planned

4. Tasks Created from the Feedback

Table 3: New YouTrack tasks

Task	Content	Owner	Deadline
DIP-20	Reformulate the novelty in the proposal and literature review	Amina	Nov 2026
DIP-21	Interviews with 3–4 information security specialists or DPOs on FR-6 and FR-7	Nazerke	Nov 2026
DIP-22	Experiment on replacement methods; requirement FR-4.5 and its metric	Amina	Nov 2026
DIP-23	Independent held-out set and second baseline in the evaluation plan	Nazerke	Nov–Dec 2026
DIP-24	Threat model, deployment condition, extension permissions, legal wording	Amina	Nov 2026
